CHAPTER 2 – REVIEWING FINANCIAL STATEMENTS

questions

LG1 1. List and describe the four major financial statements.

The four basic financial statements are:
1. The **balance sheet** reports a firm's assets, liabilities, and equity at a particular point in time.
2. The **income statement** shows the total revenues that a firm earns and the total expenses the firm incurs to generate those revenues over a specific period of time—generally one year.
3. The **statement of cash flows** shows the firm's cash flows over a given period of time. This statement reports the amounts of cash the firm generated and distributed during a particular time period. The bottom line on the statement of cash flows—the difference between cash sources and uses—equals the change in cash and marketable securities on the firm's balance sheet from the previous year's balance.
4. The **statement of retained earnings** provides additional details about changes in retained earnings during a reporting period. This financial statement reconciles net income earned during a given period minus any cash dividends paid within that period to the change in retained earnings between the beginning and ending of the period.

LG1 2. On which of the four major financial statements (balance sheet, income statement, statement of cash flows, or statement of retained earnings) would you find the following items?

a. earnings before taxes: income statement
b. net plant and equipment: balance sheet
c. increase in fixed assets: statement of cash flows
d. gross profits: income statement
e. balance of retained earnings, December 31, 20xx: statement of retained earnings and balance sheet
f. common stock and paid-in surplus: balance sheet
g. net cash flow from investing activities: statement of cash flows
h. accrued wages and taxes: balance sheet
i. increase in inventory: statement of cash flows

Answers to Chapter 2
Questions:

1. The household sector (consumers) is the largest supplier of loanable funds. Households supply funds when they have excess income or want to reinvest a part of their wealth. For example, during times of high growth households may replace part of their cash holdings with earning assets. As the total wealth of the consumer increases, the total supply of funds from that household will also generally increase. Households determine their supply of funds not only on the basis of the general level of interest rates and their total wealth, but also on the risk on financial securities change. The greater a security's risk, the less households are willing to invest at each interest rate. Further, the supply of funds provided from households will depend on the future spending needs. For example, near term educational or medical expenditures will reduce the supply of funds from a given household.

Higher interest rates will also result in higher supplies of funds from the business sector. When businesses mismatch inflows and outflows of cash to the firm they have excess cash that they can invest for a short period of time in financial markets. In addition to interest rates on these investments, the expected risk on financial securities and the business' future investment needs will affect the supply of funds from businesses.

Loanable funds are also supplied by some government units that temporarily generate more cash inflows (e.g., taxes) than they have budgeted to spend. These funds are invested until they are needed by the governmental agency. Additionally, the federal government (i.e., the Federal Reserve) implements monetary policy by influencing the availability of credit and the growth in the money supply. Monetary policy implementation in the form of increases the money supply will increase the amount of loanable funds available.

Finally, foreign investors increasingly view U.S. financial markets as alternatives to their domestic financial markets. When expected risk-adjusted returns are higher on U.S. financial securities than on comparable securities in their home countries, foreign
